PROFESSIONAL SUMMARY

DevOps-focused Computer Science student with hands-on experience building observability, deployment automation, and real-time backend systems. Designed graph-based infrastructure monitoring platforms using Neo4j, GitHub Actions, Docker, and Terraform, with a focus on reliability engineering, fault isolation, and infrastructure automation. First-place winner in an MCP-based systems engineering hackathon.

TECHNICAL SKILLS

Systems & Cloud	Linux, AWS EC2, Familiar with Kubernetes fundamentals
Containers & IaC	Docker, Terraform
CI/CD & Automation	GitHub Actions, Git, Bash / Shell scripting
Backend & Databases	Node.js, PostgreSQL, Neo4j, Redis, WebSockets, Model Context Protocol (MCP)

PROGRAMMING LANGUAGES

JavaScript, Python, C, C++, Java, TypeScript

EXPERIENCE & ACHIEVEMENTS

Software Engineering Intern

Kridtech | July 2026 – Present

- Developing the Vaniger calling subsystem, a production-grade telephony architecture integrating Telnyx, Socket.IO, and backend microservices.
- Architected an agent presence state machine and managed real-time call lifecycle data synchronization using Telnyx webhooks.
- Implemented business logic for call routing, billing pipelines, and live transcript streaming workflows.

AI & Machine Learning Intern

Artsy Technologies Pvt Ltd | May 2026 – June 2026

- Contributed to Python-based machine learning projects, collaborating on model development and integration for real-world applications.
- Worked with engineering teams to translate ML solutions into deployable software components.

1st Place — Intelligent System Hackathon

Model Context Protocol (MCP) Wrapper Development

- Designed and implemented an MCP server exposing Indian Sign Language translation capabilities to AI assistants using standardized protocol interfaces.

PROJECTS

Fortis-CI

- **Technologies:** Node.js, Neo4j, Redis, Next.js, GitHub Actions
- Designed a centralized deployment observability platform to track CI/CD execution across repositories.
- Implemented graph-based dependency modeling to support deployment tracing and failure analysis.
- Developed GitHub webhook ingestion for reliable collection of deployment metadata.

Fortis Ecosystem

- **Technologies:** Rust, TypeScript, Tauri, Kotlin, Bash, C
- Developed a comprehensive privacy-first security suite including mobile, desktop, CLI, and backend components, alongside dedicated lock, backup, and observability services.
- Implemented a unified Rust daemon (fortis-agent) exposing REST, Unix IPC, and gRPC for cross-platform integration.
- Secured with AES-256 vault encryption via SQLCipher, Ed25519 signatures, and zero-trust local pairing.

Fortis-Tools

- **Technologies:** Python, Shell, Go
- Built operational utilities and infrastructure automation scripts for the Fortis Ecosystem.

MY(suru) BUS

- **Technologies:** Node.js, PostgreSQL, React Native, Next.js, WebSockets
- Built a real-time GPS tracking platform with <2s latency using Node.js and WebSockets.
- Designed robust PostgreSQL schemas and implemented geofence-based stop detection.

Portfolio Infrastructure

- **Technologies:** Docker, Terraform, AWS EC2, GitHub Actions, Kubernetes (Minikube)
- Automated infrastructure provisioning using Terraform and containerized application deployment with Docker.
- Built GitHub Actions workflows to automate build, test, and deployment of a Next.js application.
- Configured Kubernetes (Minikube) to validate container orchestration concepts in a production-like environment.

EDUCATION

Bachelor of Engineering (Computer Science) 2023 – 2027

Maharaja Institute of Technology Mysore
